salmon by commercial fishing vessels targeting other species, such as pollock.

Poor juvenile recruitment emerged as an important factor, which was to be expected, the study said.

“Not surprisingly, we found evidence to suggest that impacts operating in the early life stages have likely contributed to declines in run sizes over the past two decades, which is consistent with previous research,” NOAA Fisheries researcher Lukas DeFilippo, the lead author, said in a statement.

But the information about spiking mortality among adults and older juveniles was new, the NOAA scientists said. That new trend represents “an apparent shift in the critical life history stages and processes” for Yukon River Chinook, and a potential bottleneck limiting population re-

covery, the study said.

Exactly how the heat wave conditions caused deaths of salmon at sea is yet to be determined, the study said. It listed several factors that could have worked in combination, including lack of suitable prey, infections by the parasite Ichthyophonus and other diseases, as well as increased energy demands brought on by warmer temperatures.

Harvests, either intentional or as bycatch, did not emerge as important factors in the recent Yukon Chinook declines, the study found.

The study contained some warnings.

Even though the marine heat wave conditions have eased, the abundance of prey that salmon need in the ocean has not returned to normal, it noted. And mortality rates in those later life stages continue to be higher than they were prior to the latest heat wave.

The heat problems for older salmon are likely to become more common in years to come, the study said.

“Given that marine heatwaves are expected to become more frequent and severe with continued warming . . . similar rises in mortality—and concomitant limitation of productivity and recovery potential—as de-

scribed here could become increasingly common in the future,” the study said.

An earlier study by NOAA Fisheries and the Alaska Department of Fish and Game tied successive heatwaves in both the Bering Sea and Gulf of Alaska to sharp declines in chum salmon stocks.

That 2023 study also pointed to higher mortality out in the ocean.
